In a real gas turbine, mechanical energy is changed irreversibly (due to internal friction and turbulence) into pressure and thermal energy when the gas is compressed (in either a centrifugal or axial compressor). Heat is added in the combustion chamber and the specific volume of the gas increases, accompanied by a slight loss in pressure. During expansion through the stator and rotor passages ...

### Gas turbine - Wikipedia

The use of mainframe gas turbines for power generation has increased in recent years and is likely to continue to increase. The proportion of power generation using combined heat and power is also growing mainly due to efficiency improvements and environmental benefits.

### Mini- and micro-gas turbines for combined heat and power

A nozzle is a device designed to control the direction or characteristics of a fluid flow (especially to increase velocity) as it exits (or enters) an enclosed chamber or pipe.. A nozzle is often a pipe or tube of varying cross sectional area, and it can be used to direct or modify the flow of a fluid (liquid or gas). Nozzles are frequently used to control the rate of flow, speed, direction ...

Le terme « compresseur centrifuge » (aussi appelé « compresseur radial ») désigne un type de turbomachines à circulation radiale et à absorption de travail qui comprend des pompes, des ventilateurs, des soufflantes et des compresseurs [1]. Les premières machines de ce type étaient composées de pompes, de ventilateurs et de soufflantes [2].

### Compressore centrifugo - Wikipedia

Il compressore centrifugo è costituito da un disco palettato (girante o impeller) messo in rotazione ad alta velocità. A causa della forza centrifuga impressa dal disco palettato, l'aria viene aspirata dal centro della girante ed accelerata radialmente con un certo incremento di pressione statica.
